

Please amend the application as follows:

In the claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

1. (currently amended) A self-expanding stent comprising a lattice,

wherein the lattice comprises a first and a second helix forming a hollow tube having a longitudinal axis and no free ends;

wherein the first helix comprises a plurality of nonsinusoidal undulations,

wherein the second helix comprises a plurality of elongate link connection elements in series with the undulations, and the connection elements connect fewer than all of the undulations in adjacent turns of the first helix, and further wherein the connection elements connect peak to valley of adjacent turns of the first helix and are positioned at an angle to the longitudinal axis of the stent and

wherein the first and second helices proceed circumferentially in opposite directions along the entire longitudinal axis of the hollow tube.

2. (original) The self-expanding stent of claim 1, wherein each undulation is formed from ascending and descending arms connected together at a junction point.

3. (original) The self-expanding stent of claim 2, wherein the connection element extends between the junction points lying on adjacent undulations.

4. (previously presented) The self-expanding stent of

claim 3, wherein the number of connection elements in each 360 degree turn of the first helix is at least two.

5. (previously presented) The self-expanding stent of claim 4, wherein the number of connection elements in each 360 degree turn of the first helix is four.

6. (original) The self-expanding stent of claim 1, wherein the undulations form a zigzag pattern.

7. (cancelled)

8. (previously presented) The self-expanding stent of claim 1, wherein the first helix terminates in a transition zone formed by a plurality of undulations which have a closed loop at one end of the transition zone and connect to the undulations forming the first helix at the other end of the transition zone and wherein the amplitude of the undulations forming the transition zone increases as the undulations proceed circumferentially from the end forming the closed loop to the end connected to the first helix.

9. (previously presented) The self-expanding stent of claim 8, wherein the two ends of the transition zone are separated by at least one 360 degree turn of the first helix.

10. (original) The self-expanding stent of claim 8, wherein the transition zone is linked by a plurality of connection elements to a closed circumferential element and the closed circumferential element is formed from a plurality of undulations.

11. (cancelled)

12. (currently amended) The self-expanding stent of claim 8 & 10, wherein the undulations of the transition zone and the closed circumferential element have a zigzag pattern.

13. (original) The self-expanding stent of claim 10, wherein the closed circumferential element is radiopaque.

14. (original) The self-expanding stent of claim 1, wherein the stent is composed of a nickel-titanium alloy.

15. (currently amended) A self-expanding stent comprising a lattice,

wherein the lattice comprises a first and a second helix forming a hollow tube having a longitudinal axis and no free ends, wherein each turn of the first helix comprises a plurality of nonsinusoidal zigzags;

wherein the second helix is formed from a plurality of elongate link connection elements in series with the zigzags and the connection elements connect fewer than all of the zigzags in adjacent turns of the first helix, and further wherein the connection elements connect peak to valley of adjacent turns of the first helix and are positioned at an angle to the longitudinal axis of the stent and

wherein the first and second helices proceed circumferentially in opposite directions along the entire longitudinal axis of the hollow tube.

16. (original) The self-expanding stent of claim 15, wherein each zigzag is formed from ascending and descending arms connected together at a junction point.

17. (original) The self-expanding stent of claim 16,

wherein the connection element extends between the junction points lying on adjacent zigzags.

18. (previously presented) The self-expanding stent of claim 17, wherein the number of connection elements in each 360 degree turn of the first helix is at least two.

19. (previously presented) The self-expanding stent of claim 18, wherein the number of connection elements in each 360 degree turn of the first helix is four.

20. (previously presented) The self-expanding stent of claim 15, wherein the first helix terminates in a transition zone formed by a plurality of zigzags which have a closed loop at one end of the transition zone and connect to the zigzags forming the first helix at the other end of the transition zone and wherein the amplitude of the zigzags forming the transition zone increases as the zigzags proceed circumferentially from the end forming the closed loop to the end connected to the first helix.

21. (previously presented) The self-expanding stent of claim 20, wherein the two ends of the transition zone are separated by at least one 360 degree turn of the first helix.

22. (original) The self-expanding stent of claim 20, wherein the transition zone is linked by a plurality of connection elements to a closed circumferential element, wherein the closed circumferential element is formed from a plurality of zigzags.

23. (original) The self-expanding stent of claim 22, wherein the closed circumferential element is radiopaque.

24. (original) The self-expanding stent of claim 15, wherein the stent is composed of a nickel-titanium alloy.

25. (currently amended) A self-expanding stent comprising at least one continuous first helix having no free ends, and a second helix;

wherein each turn of the first helix comprises a plurality of nonsinusoidal zigzags,

wherein the second helix comprises a plurality of elongate link connection elements in series with the zigzags, and the connection elements connect fewer than all of the zigzags in adjacent turns of the first helix, and further wherein the connection elements connect peak to valley of adjacent turns of the first helix and are positioned at an angle to the longitudinal axis of the stent and wherein the first and second helices proceed circumferentially along the entire length of the stent in opposite directions to form a lattice in a tubular shape.

26. (original) The self-expanding stent of claim 25, wherein each zigzag is formed from ascending and descending arms connected together at a junction point.

27. (original) The self-expanding stent of claim 26, wherein the connection elements connect two peaks lying on adjacent zigzags.

28. (previously presented) The self-expanding stent of claim 25, wherein the first helix terminates in a transition zone formed by a plurality of zigzags which have a closed loop at one end of the transition zone and connect to the zigzags forming the first helix at the other end of the transition zone

and wherein the amplitude of the zigzags forming the transition zone increases as the zigzags proceed circumferentially from the end forming the closed loop to the end connected to the first helix.

29. (previously presented) The self-expanding stent of claim 28, wherein the two ends of the transition zone are separated by at least one 360 degree turn of the first helix.

30. (original) The self-expanding stent of claim 28, wherein the transition zone is linked by a plurality of connection elements to a closed circumferential element, wherein the closed circumferential element is formed from a plurality of zigzags.

31. (original) The self-expanding stent of claim 30, wherein the closed circumferential element is radiopaque.

32. (original) The self-expanding stent of claim 25, wherein the stent is composed of a nickel-titanium alloy.

33. (currently amended) A self-expanding stent comprising a lattice, wherein the lattice comprises a first and a second helix forming a hollow tube having a longitudinal axis and no free ends, wherein each turn of the first helix comprises a plurality of nonsinusoidal zigzags,

wherein the second helix comprises a plurality of elongate link connection elements in series with the zigzags, wherein there are four connection elements in each turn of the first helix and further wherein the connection elements connect peak to valley of adjacent turns of the first helix and are positioned at an angle to the longitudinal axis of the stent and wherein the first and second helices proceed circumferentially

FROM W&C LLP 19TH FL.

(WED) 12. 21' 05 17:18/ST. 17:15/NO. 4260454094 P 9

in opposite directions along the entire longitudinal axis of the hollow tube.
